E-Commerce Platform (Online Shopping Website)

1. Project Title

E-Commerce Platform – Online Shopping Website

2. Introduction

2.1 Overview of the Domain

Nowadays many people prefer online shopping because it is easy and saves time. Customers can see products, compare prices, and order from home. Many businesses also want to sell online. But they do not always have a proper website. A e-commerce website can help them manage products and orders in an organized way. This project will focus on building a online shopping website with important features like product listing, cart system, and online payment.

2.2 Motivation of the Project

The main reason for choosing this project is that online shopping systems are very common in real life. It is a good example to apply software engineering concepts like requirement analysis, system design, development, testing, and deployment. By building this project, we will learn how a real e-commerce system works.

3. Background to the Problem

3.1 Current System Overview

Many sellers use Facebook or Instagram to sell products. Customers place orders through messages. This process is not organized. Sellers often track orders manually using notebooks or spreadsheets. Some sellers use big marketplaces, but those platforms charge commission fees and do not give full control to the seller.

3.2 Limitations of the Existing System

The existing systems have some problems:

1. No proper product catalogue system
2. No automatic cart and checkout process
3. Manual order tracking
4. Limited or no secure online payment
5. No admin panel for easy management

Because of these problems, sellers face difficulty in managing their business.

3.3 Need for the Proposed Solution

There is a need for a e-commerce platform where sellers can:

1. Add and manage products
2. Accept online orders
3. Receive secure online payments
4. Track orders easily

This system will solve common problems.

4. Problem Statement

Small and medium businesses do not have online selling system. Without a proper platform, they cannot manage products, orders, and payments efficiently. Manual processes create confusion, mistakes, and delay. So, a e-commerce website is needed to manage online sales in an organized and secure way.

5. Objectives of the Project

1. Develop a simple product catalogue with search and category options.
2. Implement a shopping cart system.
3. Create user registration and login system.
4. Integrate an online payment system (card or mobile banking).
5. Build an order management system with status update (Placed, Processing, Delivered).
6. Design a admin dashboard to manage products and orders.
7. Store all data securely in a database.
